

Interview Question

Tuesday, 22 September 2026

5:48 pm

C1. Behavioural Interview Questions (STAR Format)

1. Tell me about yourself.

Situation: I have a Computer Science degree with First Class Honours, just graduated from Charles Darwin University in Master of IT, major in Software Engineering and worked for six years at Continental Singapore in automotive software development.

Action: During my career, I worked on HMI software projects, coordinated with international teams, served as a Scrum Master, and managed requirements and project planning. I am currently pursuing a Master of Information Technology at Charles Darwin University to strengthen my business analysis and data analytics skills.

Result: This combination of technical, project, and communication experience allows me to bridge the gap between business stakeholders and technical teams effectively.

2. Describe a challenging situation you faced.

Situation: During an automotive software release, multiple requirement changes were introduced close to the testing phase.

Action: I organized discussions with stakeholders, reviewed impacts, prioritized requirements, and updated Jira tickets to ensure transparency.

Result: The team delivered the release on time with minimal defects and maintained customer satisfaction.

3. Tell me about a time you worked under pressure.

Situation: A software milestone was at risk due to unexpected integration issues.

Action: I coordinated daily progress meetings, tracked blockers, and redistributed tasks according to team capacity.

Result: We completed integration before the deadline and successfully met the customer milestone.

4. How do you manage multiple priorities?

Situation: While working as a Scrum Master, I managed development tasks, team coordination, and stakeholder communication simultaneously.

Action: I prioritized work using business impact, deadlines, and dependencies while maintaining a detailed task tracker.

Result: Project deliverables were completed on schedule, and stakeholder expectations were managed effectively.

5. Tell me about a conflict within a team.

Situation: Two developers disagreed on the implementation approach for a software feature.

Action: I facilitated a discussion focused on project objectives, technical risks, and maintainability.

Result: The team agreed on a solution supported by evidence, and collaboration improved afterward.

6. Describe a mistake you made.

Situation: Early in my career, I underestimated the effort required for a feature enhancement.

Action: I immediately informed the project lead, updated estimates, and improved my estimation process using historical data.

Result: Future estimates became more accurate, reducing planning risks.

7. Tell me about a time you adapted to change.

Situation: My team transitioned from a traditional development approach to Agile.

Action: I learned Scrum practices, participated in Agile ceremonies, and helped team members adapt.

Result: Sprint planning and collaboration improved significantly.

8. Describe a time when you demonstrated leadership.

Situation: Although I was not a formal manager, I served as Scrum Master for a small team.

Action: I facilitated sprint planning, removed blockers, and encouraged communication across stakeholders.

Result: Team productivity improved, and project milestones were consistently achieved.

9. Tell me about a time you influenced someone.

Situation: A stakeholder requested a feature that would significantly increase project scope.

Action: I presented impact analysis, resource estimates, and alternative solutions.

Result: The stakeholder agreed to a phased implementation, reducing project risk.

10. Why should we hire you?

Situation: The role requires strong analytical, technical, and communication skills.

Action: I bring six years of software industry experience, Agile delivery knowledge, stakeholder engagement experience, and current postgraduate studies in IT.

Result: I can quickly contribute by translating business needs into practical solutions while effectively collaborating with technical teams.

C2. Business Analyst Technical Questions

1. Walk me through a project where you gathered requirements.

Situation: In my mobile app assignment, I acted as the Business Analyst.

Action: I identified stakeholders, gathered requirements, documented functional and non-functional requirements, and created user stories in Jira.

Result: The project produced a complete requirements package supporting design and development activities.

2. What is the difference between functional and non-functional requirements?

Answer:

Functional requirements describe **what the system does**.

Example:

- User registration
- Login
- Bill payment

Non-functional requirements describe **how well the system performs**.

Example:

- 99.9% availability
- Response time under 2 seconds
- Security requirements

3. How do you create a BRD?

Answer:

I typically include:

- Business objectives
- Problem statement
- Scope
- Stakeholders
- Functional requirements
- Non-functional requirements
- Assumptions
- Constraints
- Risks
- Success criteria

I use Microsoft Word, Confluence, and stakeholder reviews for validation.

4. How do you handle conflicting requirements?

Situation: Different stakeholders wanted different priorities.

Action: I facilitated discussions, documented impacts, and aligned requirements with business objectives.

Result: Stakeholders reached agreement and priorities became clearer.

5. Explain gap analysis.

Answer:

Gap analysis compares:

- Current state
- Desired future state

The difference between them identifies improvement opportunities.

Tools:

- Process maps
- SWOT analysis
- Interviews
- Workshops

6. Tell us about your Agile experience.

Situation: At Continental, projects followed Agile practices.

Action: I participated in sprint planning, retrospectives, backlog refinement, and daily standups while serving as Scrum Master.

Result: Faster issue resolution and improved team collaboration.

7. How do you write effective user stories?

Answer:

Format:

As a customer

I want to view my mobile usage

So that I can monitor my data consumption.

I also define acceptance criteria and ensure stories follow INVEST principles.

8. How do you prioritize requirements?

Answer:

I use:

- Business value
- Risk
- Cost
- Dependencies

Methods:

- MoSCoW
- Priority matrices
- Stakeholder workshops

9. Explain UAT.

Answer:

User Acceptance Testing verifies the solution meets business needs.

My approach:

1. Create test scenarios.
2. Prepare test cases.
3. Coordinate users.
4. Record defects.
5. Retest fixes.
6. Obtain sign-off.

10. Describe a process improvement you identified.

Situation: During my Data Administration Officer role, repetitive student record updates created delays.

Action: I standardized workflows and improved tracking processes.

Result: Data updates became more consistent and efficient, reducing administrative effort.

C3. Data Analyst Technical Questions

1. Describe a data analysis project.

Situation: I completed a Titanic survival prediction project using machine learning.

Action: I cleaned data, handled missing values, encoded categorical variables, standardized features, and trained Logistic Regression, Decision Tree, Random Forest, and KNN models.

Result: KNN achieved approximately 81.6% accuracy while providing insights into key survival factors.

2. Explain SQL joins.

Answer:

Join	Description
INNER JOIN	Matching records only
LEFT JOIN	All records from left table
RIGHT JOIN	All records from right table
FULL JOIN	All records from both tables

3. How do you handle missing data?

Answer:

Methods include:

- Remove records
- Mean/median imputation
- Mode imputation
- Predictive imputation

Choice depends on data quality and business requirements.

4. Tell us about a dashboard you built.

Situation: For data analysis coursework, I created Power BI dashboards.

Action: I developed KPI cards, trend charts, filters, and visual summaries.

Result: Users could quickly identify trends and performance indicators.

5. What SQL functions do you use most?

Answer:

- COUNT()
- SUM()
- AVG()
- MIN()
- MAX()
- GROUP BY
- HAVING
- CASE
- ROW_NUMBER()
- RANK()

6. Explain descriptive, diagnostic, predictive, and prescriptive analytics.

Type	Purpose
Descriptive	What happened?
Diagnostic	Why did it happen?
Predictive	What may happen?
Prescriptive	What should we do?

7. How do you validate analysis results?

Answer:

I perform:

- Data quality checks
- Outlier reviews
- Cross-validation
- Peer review
- Comparison against source systems

This ensures accuracy and reliability.

8. Explain correlation vs causation.

8. Explain correlation vs causation.

Answer:

Correlation means two variables move together.

Causation means one variable directly causes changes in another.

Example:

Ice cream sales and drowning incidents increase together in summer, but ice cream does not cause drowning.

9. Describe your diabetes machine learning project.

Situation: I analyzed a diabetes health dataset containing over 250,000 records.

Action: I cleaned the dataset, recoded target variables, explored feature importance, and evaluated classification models using accuracy, precision, recall, and F1-score.

Result: The project demonstrated how machine learning can identify diabetes risk factors and support healthcare decision-making.

10. Which project best demonstrates your analytical skills?

Answer:

The remote connectivity challenge project demonstrates my analytical skills best.

Situation: Remote Australian communities face connectivity challenges.

Action: I combined multiple datasets including mobile coverage, NBN data, community profiles, and geographic information to identify underserved communities.

Result: The analysis provided evidence-based insights that could support infrastructure planning and improve access to education and services.
